**MONSOON EFFECT TO WAVE POWER FOR WAVE ENERGY
CONVERTER IN MANDI DARAH ISLAND, MALAYSIA**

NUR SYAFIQA AIFA BINTI SHAHROM

Thesis submitted to the Centre for Graduate Studies, Universiti Pertahanan Nasional
Malaysia, in fulfilment of the requirements for the Degree of Master of Science
(Maritime Technology)

2022

ABSTRACT

Malaysia is surrounded by the sea, which brings on an important part of ocean energy research especially in the aspect of wave power. Malaysia has been engaged in the recent growth of renewable energy and has contributed to utilising ocean energy through wave energy converters (WEC). To assess the ocean energy needed for a WEC, research was conducted to measure the wave power potential near Mandi Darah Island. Mandi Darah Island was utilising a generator to power the village at the time, which deemed insufficient. WEC was discovered to be another approach to sustain energy supply for the entire village in order to address this difficulty. From June to December 2018, wave height and wave period data were collected and analysed with an Acoustic Doppler Current Profiler (ADCP) to evaluate wave power. The wave power potential was derived from the observation data using the wave power equation and determine the effects of the Northeast Monsoon (NEM), Southwest Monsoon (SWM) and inter-monsoon period, especially on the nearshore in northern Sabah. The wave power analysis from ADCP was compared with wave power from third-generation wave model (MRI3_S) during the same period. The maximum wave power potential during the NEM was far greater than during the SWM and the inter-monsoon season, while the MRI3_S overestimated it by 7%. Wind speed data during the monsoon was acquired through the same period with value 6.68 m/s during the NEM. The six-month study period revealed wide ranges in wave height and wave power potential during the NEM, with the highest wave power and wave height observed to be 1.57 kW/m and 0.49 m, respectively, during the period. From the comparison of wave power between ADCP and MRI3_S, the research successfully proved that

monsoon effect the wave power. The findings of this study can be conducted at any place to evaluate the potential of WEC project.

ABSTRAK

Malaysia dikelilingi oleh laut, yang membawa bahagian penting dalam penyelidikan tenaga lautan terutamanya dalam aspek kuasa ombak. Malaysia telah terlibat dalam pertumbuhan tenaga boleh diperbaharui baru-baru ini dan telah menyumbang kepada penggunaan tenaga lautan melalui penukar tenaga gelombang (WEC). Untuk menilai tenaga lautan yang diperlukan untuk WEC, penyelidikan telah dijalankan untuk mengukur potensi kuasa gelombang berhampiran Pulau Mandi Darah. Pulau Mandi Darah sedang menggunakan generator untuk membekalkan tenaga kepada kampung pada masa itu, yang dianggap tidak mencukupi. WEC didapati sebagai satu lagi pendekatan untuk mengekalkan bekalan tenaga untuk seluruh kampung bagi menangani kesukaran ini. Dari Jun hingga Disember 2018, data ketinggian gelombang dan tempoh gelombang telah dikumpul dan dianalisis dengan *Acoustic Doppler Current Profiler* (ADCP) untuk menilai kuasa gelombang. Potensi kuasa ombak diperoleh daripada data cerapan menggunakan persamaan kuasa ombak dan menentukan kesan Monsun Timur Laut, Monsun Barat Daya dan tempoh antara monsun, terutamanya di pantai berhampiran di utara Sabah. Analisis kuasa gelombang daripada ADCP dibandingkan dengan kuasa gelombang daripada model gelombang generasi ketiga (MRI3_S) dalam tempoh yang sama. Potensi kuasa gelombang maksimum semasa Monsun Barat Daya adalah jauh lebih besar daripada semasa Monsun Timur Laut dan musim antara monsun, manakala MRI3_S melebihkannya sebanyak 7%. Data kelajuan angin semasa monsun diperoleh melalui tempoh yang sama dengan nilai 6.68 m/s semasa Monsun Barat Daya. Tempoh kajian selama enam bulan mendedahkan julat luas dalam ketinggian gelombang dan potensi kuasa

gelombang semasa Monsun Barat Daya, dengan kuasa gelombang tertinggi dan ketinggian gelombang diperhatikan masing-masing ialah 1.57 kW/m dan 0.49 m, dalam tempoh tersebut. Daripada perbandingan kuasa gelombang antara ADCP dan MRI3_S, penyelidikan berjaya membuktikan bahawa monsun memberi kesan kepada kuasa gelombang. Dapatan kajian ini boleh dijalankan di mana-mana tempat untuk menilai potensi projek WEC.

ACKNOWLEDGEMENTS

In the Name of Allah, the Beneficent, the Merciful

First, praise be to Allah, the Almighty, on whom ultimately we depend for sustenance and guidance. Second, my sincere appreciation goes to my supervisors Lt. Cdr. Ts. Mohd Azzeri bin Md Naiem RMN (Rtd), Cdr. Mohd Shukri bin Mohd Yusop RMN and Lt. Cdr. Assoc. Prof. Ts. Dr. Mohd Norsyarizad bin Razali RMN (Rtd) for the continuous support during my Master's Degree research and for the patience, motivation, enthusiasm and immense knowledge. The guidance helped me throughout the period of researching and writing this thesis. I could not have imagined having better advisors and mentors for my study. Besides my advisor, I would like to thank Mr. Diong Yik Jeong, Mr. Nursaleh K. Chang and the rest of the team from the Malaysian Meteorology Department for the full support and commitment that they gave me through my research. Last but not least, I would like to thank my teammates at Universiti Pertahanan Nasional Malaysia (UPNM) for helping me towards the accomplishment of this research work. Thank you for all your technical assistance and cheerful moments. Most importantly, none of this would have been possible without the love and patience of my family. I am grateful to my amazing family members who always give me support in every respect and who have been a source of encouragement and inspiration to me throughout my life. Finally, to EXO and NCT, thank you for your existence. Once again, thank you to all who have contributed to my studies.

APPROVAL

The Examination Committee has met on **13 January 2022** to conduct the final examination of **Nur Syafiq Aifa binti Shahrom** on his degree thesis entitled **Monsoon Effect to Wave Power for Wave Energy Converter in Mandi Darah Island, Malaysia.**

The committee recommends that the student be awarded the of Master of Science (Maritime Technology).

Members of the Examination Committee were as follows.

Assoc. Prof. Dr. Nanthini Sridewi a/p Appan

Faculty of Defence Science and Technology
Universiti Pertahanan Nasional Malaysia
(Chairman)

Lt. Cdr Ir. Ts. Mohd Najib bin Abdul Ghani Yolhamid RMN (Rtd)

Faculty of Defence Science and Technology
Universiti Pertahanan Nasional Malaysia
(Internal Examiner)

Assoc. Prof. Ir. Dr. Shayfull Zamree bin Abd Rahim

Faculty of Engineering
Universiti Malaysia Perlis
(External Examiner)

APPROVAL

This thesis was submitted to the Senate of Universiti Pertahanan Nasional Malaysia and has been accepted as fulfilment of the requirements for the degree of **Master of Science (Maritime Technology)**. The members of the Supervisory Committee were as follows.

Lt. Cdr. Ts. Mohd Azzeri bin Md Naiem RMN (Rtd)

Faculty of Defence Science and Technology

Universiti Pertahanan Nasional Malaysia

(Main Supervisor)

Cdr. Mohd Shukri bin Mohd Yusop RMN

Faculty of Defence Science and Technology

Universiti Pertahanan Nasional Malaysia

(Co-Supervisor)

Lt. Cdr. Assoc. Prof. Ts. Dr. Mohd Norsyarizad bin Razali RMN (Rtd)

Faculty of Defence Science and Technology

Universiti Pertahanan Nasional Malaysia

(Co-Supervisor)

UNIVERSITI PERTAHANAN NASIONAL MALAYSIA

DECLARATION OF THESIS

Student's full name : Nur Syafiqa Aifa binti Shahrom
Date of birth : 27th July 1996
Title : Monsoon Effect to Wave Power for Wave Energy Converter
in Sabah, Malaysia
Academic session : March 2019

I hereby declare that the work in this thesis is my own except for quotations and summaries which have been duly acknowledged.

I further declare that this thesis is classified as:

- CONFIDENTIAL** (Contains confidential information under the official Secret Act 1972)*
- RESTRICTED** (Contains restricted information as specified by the organisation where research was done)*
- OPEN ACCESS** I agree that my thesis to be published as online open access (full text)

I acknowledge that Universiti Pertahanan Nasional Malaysia reserves the right as follows.

1. The thesis is the property of Universiti Pertahanan Nasional Malaysia.
2. The library of Universiti Pertahanan Nasional Malaysia has the right to make copies for the purpose of research only.
3. The library has the right to make copies of the thesis for academic exchange.

T_p	- Peak period
kW/m	- Kilowatt per metre
s	- Second
m/s	- Metres per second

CHAPTER 1

INTRODUCTION

1.1 Research Background

The monsoon is defined as a seasonal wind change accompanied by commensurate changes in precipitation caused by asymmetric heating of the land and sea (Geen et al., 2020). The monsoon also refers to the rainy season (Singh et al., 2014) as part of a seasonally changing pattern. Although the wind in Malaysia is generally weak and its direction is changeable, there are regular changes in wind blowing patterns (Azhar, 2011). The key features of the climate in Malaysia are uniform high humidity and rainfall throughout the day. Malaysia is also characterised as having uniform temperatures, light winds, high humidity and four monsoon phases. Four monsoon seasons can be distinguished: the Northeast Monsoon (NEM), the Southwest Monsoon (SWM) and two short-term inter-monsoon periods (Saadon et al., 1999). The NEM lasts from November to March, when the wind generally comes from the northeast of Malaysia (Muthurajah et al., 2021). The wind speed during the NEM is between 10 and 30 knots. Monsoon weather systems that develop in conjunction with cold air outbreaks from Siberia produce heavy rains that often cause severe flooding in many countries. The SWM phase lasts from May to September, when the wind generally comes from the southwest and the wind speed is below 15 knots (Muthurajah

et al., 2021). The SWM is the driest season for most states except Sabah (B. W. K. Chong et al., 2020). Most states experience the minimum monthly rainfall at this time, which can be characterised by relatively stable atmospheric conditions in the equatorial region. The two short-term inter-monsoon periods last from the end of March until early May and from October until the middle of November (Geen et al., 2020). During these periods, the wind is slow in all directions. Between April and November, typhoons frequently form in the western Pacific and move westwards across the Philippines. Northeasterly winds in the northwest regions of Sabah and Sarawak strengthen and can reach 20 knots or more (B. W. K. Chong et al., 2020; Muthurajah et al., 2021). The wind created monsoon give effect to oceanographic.

Most oceans are influenced to a considerable extent by the monsoon system. In fact, every oceanographic environmental feature is influenced by the monsoon (J. Huang et al., 2018). Two basic approaches can be used to determine wave properties. The first is related to physics-based approaches (Teller et al., 2002), which use an ocean wave model, and the second is related to statistical approaches, which analyse wave data patterns using interpolation methods. In this research, a physics-based approach was used to investigate wave power in a coastal area because it offers an advantage of being able to depict water dynamics consistently across the entire domain, not only where it was calibrated (Vadyala et al., 2022). Wave power, a renewable energy source transported by ocean waves, is highly eco-friendly and easily accessible (Maulud & Saidi, 2012). Wave exploration has become a new topic of interest to researchers worldwide, including in Malaysia. Wave energy is related to solar energy in that the sun's energy is stored in the oceans as thermal energy and mechanical energy is stored in ocean waves (Pradhan., 2016) and provides a number

of advantages over other renewable energy sources, including high availability compared to other resources, resource predictability, high power density, relatively high consumption factor, and low environmental and visual impacts (Am et al., 2010). Furthermore, as a result of substantial recent research in the production of wave energy converters, wave energy is approaching practicality as a commercial power source (Carballo et al., 2014).

In particular, wave energy is progressively seen as a significant and promising resource in Sabah, as the state is surrounded on three sides by sea: the South China Sea, the Sulu Sea and the Celebes Sea (Ejria et al., 2010). Geographically, Mandi Darah Island is a small island located in Kudat Division (Monaliza & Samsur, 2011), which is in the northern area of Borneo Island at latitude $6^{\circ}55'44.52''$ N and longitude $117^{\circ}20'2.37''$ E. Mandi Darah Island is exposed to monsoon winds, especially the Northeast Monsoon (NEM), and experiences slight storms in some seasons. This is because Mandi Darah Island is surrounded by the Sulu Sea. The Sulu Sea, like the Mediterranean, is an enclosed sea and is separated from the surrounding waters by a chain of islands: Borneo Island to the southwest; Palawan to the west; Busuanga and Mindoro to the north; Panay, Negros and Mindanao to the east and the Sulu Archipelago to the southeast (Ejria et al., 2010). The inhabitation of Mandi Darah Island is limited, with about 35 houses constructed on the beach and where between 40 and 75 people remain. Due to the lack of infrastructure, wave energy is used to supply electricity to the villages and the army camp situated on Mandi Darah Island.

(a) Waves have certain characteristics and energy densities in different locations (Melikoglu, 2018). The evaluation of wave energy resources is not only a basic
